

DEVELOP A MEDICINE BASED ON THE NATURAL AND INNATE CAPACITIES OF THE BODY TO SELF-REGENERATE IN ORDER TO STAY BALANCED

Isabelle BOURGAI¹

¹ Future Humanitarian Ambulant Doctor, Creator of Ki-Regeneration – <https://ArtScienceCreativite.info>.

December 2020 version

Two years ago, I wrote the research project to study the physical reality of the human body in order to develop an innate self-regeneration program that can go as far as regenerating amputated limbs, but I did not find research laboratory to fund it.

In early March 2020, containment arrived and I began to study human anatomy on my own.

This study allowed me to realize that the biological perfection of the human body is based on a simple functional architecture:

- All the functions of the human body aim to maintain the body in good health, protecting it from external aggressions and maintaining a balance between all the elements that constitute it.
- As soon as a change occurs, the part of the body involved is taken care of, isolated, treated, then the impacted space is cleaned, before being readjusted so that the balancing programs allow it to regain its place in balance among all the building blocks of the body.
- Two types of changes can occur that will be handled differently in the body:
 - The “pre-parameterized” changes, universal and specific changes of the human species. When they occur the body will look in "the universal library" for the registered mechanisms that it will have to carry out, these mechanisms will be the same for everyone, as well as their physical implication: for example puberty, menopause, fertilization. and all stages of embryonic development until childbirth, the immune reaction, inflammatory reactions, ...
 - The "self-learning" changes, particular and specific events of individual life. It is impossible for the human body to predict in advance the external aggressions which will occur, so when a change occurs and it is not registered in "the universal library", the biological functions are able of learning, and the balancing programs register the mechanisms in the “biological library” of the individual so that he is more reactive the second time; the implications will be different from one individual to another because they depend on the biological, mineral, genetic, ... constitution of the individual: for example lymphocyte memory, allergies, ...
- This implies the existence of "libraries" containing the universal and individual biological mechanisms that the body uses to respond to a change in balance, as well as balance programs used at the end of change management, in order to that the isolated part which has undergone the aggression can find its place within the whole organism, and relations between the libraries which are probably made during embryogenesis and induce the biological, mineral, genetic predisposition, ... of the individual.

After seven months of studying human anatomy, I realize that the Ki-Regeneration® that I am creating is **medicine based on the natural and innate capacities of the body to self-regenerate to stay balanced**.

The principle of healing is as follows:

The body is maintained in good health thanks to programs of treatment of the changes, of balancing between all the constituents, by the constant renewal of these cells, and a "universal library" containing the natural mechanisms to be applied. **If he falls ill, it is because one or more of these programs is not working correctly or because their link to the "universal library" is disrupted or because errors have been added in "the individual library"**. If we understand how these programs and biological libraries work, we will be able to heal the body by removing the root causes of the disruption of the activity of these programs and their unsuitable link to “the universal library”. The programs will then run naturally and correctly, they will renew the cells carrying an anomaly with healthy cells, allowing the person to regain the health of a balanced universal body.

To heal people, I have to understand the programs of environmental checking, adaptation, information processing, balancing, self-learning, memorization, the "biological libraries" and the causes that cause the programs to let something go, at times, which causes them to be out of order.

Here are the steps to understand how the human body balancing works. This will last about five years:

- The first year: Learn the basics of a healthy body and a sick body; develop the bases of healing, the principle of the natural self-regenerating medicine of the body
 - Human and animal anatomy, embryology, pathology: general, anatomical, neuroanatomical, cardiac, digestive, immunological;
 - Naturopathy and homeopathy: *to understand their principle of healing and reprogramming*;
 - Chinese medicine, yin, shiatsu: *to understand the yin-yang balance of the body*;
 - The voice: *to understand the integration of elements of a different physical nature in a common goal*.

I want to work in parallel on animals, mainly farm, zoo or wild animals, because I think that the balancing programs are more accessible and the link with the "universal library" is direct.

- At the end of the year, and the following year (2nd year): Practice self-regeneration
 - Carry out internship in the centers of therapeutic Yoga, Ayurvedic medicine, Yin, ... to learn their knowledge and develop my practice resulting from the theory acquired the first year.

I want to develop part of my activity in volunteering in Bhopal, in dispensaries, ...

- From the end of the second year, and the third year: Application for pain management
 - Chronic pain, fibromyalgia, the feeling of the phantom limb for amputees, could be created when the injured part regains the full balance of the body:
 - Balancing programs must have a function that says "everything is in equilibrium, change processed", here this function would return nothing or a message "something is wrong", but "the biological library" would block the mechanism to process it, then this message would become an "incoherent balance" aggression for the body which would repeat it punctually to try to resolve it, causing pain or an unpleasant sensation that is chronic.
 - Health is both a natural capacity of the body to be in balance but also the balance that a person has within his family, his work, his environment, and society. It is very difficult to change your habits, and to think about what is wrong when the pain is there.

Therefore, I want to develop **a self-regeneration center to take away the pain and prevent it from coming back**. I think it's important to take the pain away first, and then help the person get back into balance in their life. I propose to bring together in the same place, for a period whose duration will be determined, nurses, doctors, and alternative medicine therapists (naturopathy, meditation, personal development, ...) who will intervene after the application of care that I will have developed to suppress the pain and will allow to understand that it was its cause in order to remove the origin so that the pain does not return.

To achieve this, I need to acquire the anatomical skills to understand pain and surround myself with complementary therapists to best help people.

- The fourth year: Seeking to understand "the individual biological library"
 - The human being is a physical body, but he is also influenced by his thoughts, his emotions, his memories. He is an intelligent, sensitive, creative being, whose state of health depends on his own history.
 - Conduct research on denial, consciousness, cognition, creativity in order to understand the impact of individual history on health.

I want to write books in order to popularize what I have discovered about the body and human nature. And why not start training people in self-regenerating medicine.

- The fifth year: Being a doctor
 - Study the pharmacology: cardiovascular and respiratory, pain medications, inflammatory, immune, rheumatic pathologies, anesthesia, anti-infectives. Understand the side effects, which also appear during stress: *what causes the body to fail to regain / maintain its natural state of balance and how to resolve this "no return"*.
 - Study psychosomatic illnesses. The drugs have an effect on the patient, this shows that there is a physical component that can be cured by self-regenerating medicine.
 - I am not for stopping drugs, when a person is in pain, the first thing to do is to stop the pain and then treat the cause. I am for the removal of side effects.

When I have understood the biological programs and libraries of the human body, the functioning of side effects, I wish to implement a procedure for authorization to practice in order to be recognized as **a Doctor**.

I want to have **part of my activity focused on humanitarian aid, part as an itinerant country doctor and develop self-regeneration centers**. I will also be able to put my experience on animals at the service of veterinary surgeries if a pandemic or a need arises.

To achieve this, I want to follow my training plan to understand the programs of checking, adaptation, processing, balancing, self-learning, memorization and the "biological libraries". I know there is a lot of work, learning, and practice involved in healing people.

I am looking for a job that allows me to work full time on this self-regenerating medicine. Either a minimum of one year funding to open a self-regeneration center in Ternay in the Loir et Cher, or 5 years to have a financial base during the full time of the training.

When I get this job, I can continue to develop my medical covid analysis:

- The virus is not inherently dangerous, it does not affect vital organs and allows asymptomatic people to live, but it multiplies quickly, affects the senses, proliferates and mutates rapidly.
- It lyses the olfactory cells releasing components present in these cells and not naturally present in the body. These molecules act like any component from food, air, .. and we get allergic or inflammatory reactions as with peanuts, pollutants, toxins,...
- It would be interesting to manage the reaction to the specific components present in our olfactory cells, allergic reaction or other, *it seems that the thyroid can be affected*. My medical knowledge is minimal, but wouldn't it be possible that people with respiratory failure have a severe allergic reaction? who could be treated with anti-allergic or autoimmune solutions?
- To decrease the rate of contamination, it would be wise to systematically test people who have immunosuppressive therapy and / or an absence of taste and smell since the virus does not affect vital organs but the senses. We can live with it until the day when asymptomatic people will die by the thousands, from the accumulation of non-vital side effects which gradually worsen themselves and lose sight of the trigger to correct; *non-vital side effects such as the action of cigarettes*.
- Last question on RNA vaccines. The virus mutates quickly, when asymptomatic people are going to be vaccinated, won't the virus already present in their body mutate more easily when it comes into contact with the RNA of the vaccines? Because they will meet. *Is there a connection with the new English strain? Vaccination has started. Maybe it's a coincidence, it's possible. it's a question waiting to be answered.*

With this job, I will be able to start medical prospects. I own a house in France, in the "Loir et Cher" which will be able to accommodate the self-regeneration center, after work. I will start looking for therapists, to keep the center alive and see how to set up others elsewhere in France and in the world. In less than 2 years, I will be able to collaborate with existing pain relief centers and from now on I will contact veterinary surgeries or zoos to collaborate. And in 5-6 years, I will get to my prospect of getting licensed to practice medicine.

I know that talking to people from the same professional branch is important. Confronting different points of view on the same subject is positive. The world is changing, so is medicine.

I can already show the diagrams obtained for the balancing programs, as well as the place, the importance of each organ, and the details of my self-training, during an interview.
